DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 4/28/2005 has been entered.

Response to Arguments

- 2. In response to communications filed on 8/1/2005, applicant amends claims 1-5, 13, 14, and 20-24. The following claims 1-31 are presented for examination.
- 2.1 The amendment to the abstract, filed on 4/28/2005 has been considered. However, the abstract should not repeat information given in the title and should avoid using phrases which can be implied, such as, "The disclosure concerns," "The disclosure defined by this invention," "The disclosure describes," etc.. Therefore, the abstract is still objected.
- Applicant's remarks, pages 11-13, filed on 4/28/2005, with respect to the rejection of claims 1-31 have been fully considered, but they are not persuasive. Applicant indicates that Beetcher's version field cannot be applied to the computer as a whole and therefore cannot anticipate the claimed invention. However, the version field of Beetcher is only one of the

plurality of the entitlements disclosed. Beetcher also discloses other entitlements such as charge group, key type, serial number of the machine, and product entitlement field assigned to the device (see column 6, lines 20-40). In another embodiment, Beetcher discloses in column 7, lines 1-16, other authorization levels that are hardware specific. There is suggestion in column 2, lines 49-53 that other entitlement may also be machine specific entitlement or authorization level assigned to a machine to make sure that a software is authorized to run on a specific machine. Siefert also discloses key codes containing authorization levels (column 2, lines 40-65) and the key codes are assigned to an electronic device and authorizes said electronic device to run controlled applications according to the weighting levels described in column 4, line 44 through column 5, line 55. The cited art Beetcher either alone or in combination with Siefert teaches or suggests the claims as amended. Therefore, applicant has not overcome the rejection by amending the claims to recite that the first authorization level "is assigned to said electronic device". Upon further consideration, to render the claim rejection more obvious, claims 1-31 are now rejected in view of Beetcher and Siefert.

Specification

3. The abstract of the disclosure is objected to because the amended abstract recites, "Specifically, a method and system for implementing a security technique that enables an electronic device to run controlled test applications is described", this language is not proper to the proper language of an abstract of the disclosure as explained below. Correction is required. See MPEP § 608.01(b).

Applicant is reminded of the proper language and format for an abstract of the disclosure.

The abstract should be in narrative form and generally limited to a single paragraph on a separate sheet within the range of 50 to 150 words. It is important that the abstract not exceed 150 words in length since the space provided for the abstract on the computer tape used by the printer is limited. The form and legal phraseology often used in patent claims, such as "means" and "said," should be avoided. The abstract should describe the disclosure sufficiently to assist readers in deciding whether there is a need for consulting the full patent text for details.

The language should be clear and concise and should not repeat information given in the title. It should avoid using phrases which can be implied, such as, "The disclosure concerns," "The disclosure defined by this invention," "The disclosure describes," etc.

Claim Rejections - 35 USC § 103

- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4.1 Claims 1-31 are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent 5,933,497 to Beetcher et al. in view of US Patent 6,526,512 to Siefert et al.
- 4.2 As per claims 1 and 20, Beetcher et al. discloses a method of security comprising the steps of: enabling a computer system to execute a software module with an encrypted entitlement key containing at least a machine serial number and version number that indicates sufficient

authority to execute that meets the recitation of a) enabling an electronic device to run a controlled application with an encrypted record containing a copied serial number and a first authorization level, for example (see column 6, lines 20-67); Beetcher et al. discloses that each customer receives an entitlement key enabling the customer to run only those software modules to which he is entitled (column 4, lines 40-45) that meets the recitation of wherein said first authorization level authorized said electronic device to run controlled applications having authorization levels not exceeding said first authorization level. Beetcher also discloses other entitlements such as charge group, key type, serial number of the machine, and product entitlement field assigned to the device (see column 6, lines 20-40). In another embodiment, Beetcher discloses in column 7, lines 1-16, other authorization levels that are hardware specific assigned to said electronic device. There is suggestion in column 2, lines 49-53 that other entitlement may also be machine specific entitlement or authorization level assigned to a machine to make sure that a software is authorized to run on a specific machine. b) verifying said electronic device is correctly enabled, for example (see column 6, line 65 through column 7, line 47); and c) verifying said first authorization level is of sufficient authority to run said controlled application on said electronic device, for example (see column 6, line 65 through column 7, line 47); and wherein a second authorization level of said controlled application does not exceed the first authorization level (column 7, lines 1-65). Beetcher et al suggests to add protection by using entitlement that contains machine specific information and encoding it into the software itself. Siefert et al. in an analogous art teaches key codes containing authorization levels (column 2, lines 40-65) and the key codes (authorization levels) are assigned to an electronic device and authorizes said electronic device to run controlled applications having

authorization levels not exceeding said first authorization level (see column 4, line 44 through column 5, line 55). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method of **Beetcher et al** wherein the first authorization level is assigned to the electronic device and authorizes the electronic device to run controlled applications having authorization levels not exceeding the first authorization level as taught by **Siefert et al** (see column 4, line 44 through column 5, line 55). One skilled in the art would have recognized the advantage of preventing hacker from learning the identities of the key codes and preventing hacker from learning how the security process run by assigning key codes (authorization levels) to both the computer and the program by a match determination process and using region of memory non-accessible to users to store the key codes (authorization levels) as suggested by **Siefert et al** (column 7, lines 15-25 and column 7, line 55 through column 8, lines 59-67).

As per claims 2, 14, and 21, Beetcher et al. discloses the limitation of wherein step a) comprises the steps of: a1) fetching a serial number uniquely associated with said electronic device, said serial number located on said electronic device, for example (see column 7, line 47); a2) copying said serial number, forming said copied serial number that is identical to said serial number, for example (see column 6, lines 20-40); a3) creating a record that contains said copied serial number and said first authorization level, said first authorization level previously assigned to said electronic device, for example (see column 6, lines 20-40); a4) encrypting said record, forming said encrypted record, for example (see column 4, lines 57-65 and column 8, lines 53-65); and a5) storing said encrypted record in said electronic device, for example (see column 8,

lines 53-65). These claims are also rejected on the same rationale as the rejection of claim 1 for reciting "said first authorization level previously assigned to said electronic device".

As per claims 3 and 22, Beetcher et al. discloses the limitation of wherein step b) comprises the steps of: bl) locating said encrypted record, for example (see column 9, line 40 through column 10, line 20); b2) decrypting said encrypted record, if said encrypted record is located, for example (see column 9, line 40 through column 10, line 20); b3) reading said copied serial number from said encrypted record, if said encrypted record is successfully decrypted; b4) fetching said serial number, for example (see column 9, line 40 through column 10, line 20); and b5) comparing said serial number and said copied serial number, for example (see column 9, line 40 through column 10, line 20 and column 13, lines 1-8).

As per claims 4 and 23, Beetcher et al. discloses the limitation of wherein step b) comprises the further step of executing said controlled application on said electronic device, said controlled application having controlled attributes, for example (see column 6, lines 40-67);

As per claims 5, 12, 24, and 31, the combination of Beetcher et al and Siefert et al discloses the limitation of wherein said step c) comprises the steps of: c1) reading said first authorization level from said encrypted record that is decrypted, if said serial number and said copied serial number match, for example (see Beetcher et al, column 9, lines 40-67 and column 10, lines 20-67); c2) comparing said first authorization level with a second authorization level assigned to said controlled application (Beetcher et al, column 10, lines 40-4 and column 7); and

c3) allowing access to said controlled attributes of said controlled application, if said first authorization level is of an equal or higher authorization level than said second authorization level, for example (see **Beetcher et al**, column 10, lines 20-47 and column 4, lines 34-46). Siefert et al also discloses comparing first authorization level with second authorization level to authorize the computer to run controlled applications as discussed in claim 1. Therefore, these claims are also rejected on the same rationale as the rejection of claim 1.

As per claims 6, 15, and 25, Beetcher et al. discloses the limitation of wherein step a) is performed with object code instructions that meet the recitation of an enabler application, said enabler application enabling said electronic device to run applications having authorization levels equal to or lower than said first authorization level, for example (see column 8, lines 48-67 and column 4, lines 34-46).

As per claims 8, 9, 18, 19, 27, and 28, the combination of Beetcher et al and Siefert et al discloses the limitation of comprising the further step of: aborting said application and denying access if any of the following conditions are met: said encrypted record is not successfully located in step b1); said encrypted record is not successfully decrypted in step b2); said serial number and said copied serial number do not match in step b5); or said first authorization level is of a lesser value than said second authorization level in step c2), for example (see Beetcher et al, column 8, lines 48-67 and column 4, lines 34-46 and column 10, lines 20-67).

Claims 13 and 16 contain some of the limitations of the rejected claims 1-5. Therefore, claims 13 and 16 are rejected on the same rationale as the rejection of claims 1-5.

As per claim 17, Beetcher et al. discloses the limitation of wherein the same encryption/decryption protocol is used in performing steps c) and m), for example (see column 13, lines 5-18).

As per claims 7 and 26, Beetcher et al. substantially teaches the claimed method of claims 6 and 25. Beetcher et al. does not explicitly teach removing said enabler application from said electronic device after successfully completing step a). However, Siefert et al. in an analogous art teaches control access to enhance security of resources where a match determination process can take actions of erasing part or all of the program to defeat running of the program, for example (see column 7, lines 35-40). Siefert et al. also adds, hiding process/codes or removing or placing them in separate memory or non-accessible memory locations can prevent hackers to trace the logic of codes, for example (see column 7, line 40 through column 8, line 5). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method of Beetcher et al. to remove said enabler application from said electronic device after successfully completing step a) as taught by Siefert et al. One skilled in the art would have been lead to make such a modification because it would make the security process non accessible to hackers, as suggested by Siefert et al for example (see column 7, line 40 through column 8, line 35).

As per claims 10-11 and 29-30, Beetcher et al. discloses locking in memory the version number the product number, serial number etc. and also discloses codes stored in read-only memory (ROM) to make it not capable of alteration by customers, for example (see column 7, lines 15-30 and column 9, lines 49-67). It is well known in the art of computer security that computers have flash memory and using a flash memory will not depart from the spirit and scope of the invention of Beetcher et al. Siefert et al. also discloses using read-only memory (ROM) for the encrypted data and serial number. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to store said encrypted record and serial number in locked flash record in said electronic device as suggested by Beetcher et al. One skilled in the art would have been lead to make such a modification to prevent alteration of these data by customers.

Conclusion

5. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Carl Colin whose telephone number is 571-272-3862. The examiner can normally be reached on Monday through Thursday, 8:00-6:30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ayaz Sheikh can be reached on 571-272-3795. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent

Application Information Retrieval (PAIR) system. Status information for published applications

may be obtained from either Private PAIR or Public PAIR. Status information for unpublished

applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
